

Worked for 33s

Yes! I isolated only the **1,615 records** where `eventType` is exactly `"InputEvent"` and checked the `sceneName` field and every subvariable inside `data`. The results below are taken directly from the uploaded gameplay log. `wenyi081326-1.stratalog.logdata`

1. Unique values of `sceneName`

There are **9 unique** `sceneName` values for `InputEvent`:

<code>sceneName</code>	Number of <code>InputEvent</code> records
Unit 4 Dev - Dungeon	388
Unit 3 Dev	325
Unit 5 Dev - Dungeon	312
Unit 3 Dungeon Dev	183
Unit 1 Dev	126
Unit 4 Dev	125
Unit 5 Dev	80
Unit 2 Prod (Refactor)	49
Unit 4 Dev - Anderson Base	27

These counts total **1,615**, and I did not find any `InputEvent` record with a missing `sceneName`.

2. Subvariables contained within `data`

For `InputEvent`, every `data` object contains exactly these **4 subvariables**:

```
actionType
playerOrDrone
key
Value
```

The unique values for each are:

data	subvariable	Unique values
actionType		Move , Interact , Sprint , Ascend , Hoverboard , Jump , Map , Pause , ToggleDebug
playerOrDrone		Player , Drone
key		w , a , leftButton , d , leftShift , s , e , h , space , m , tab , backquote , "" (empty string)
Value		pressed

More specifically, their frequencies are:

actionType	
Value	Count
Move	1,137
Interact	243
Sprint	199
Ascend	15
Hoverboard	8
Jump	5
Map	5
Pause	2
ToggleDebug	1
playerOrDrone	
Value	Count
Player	1,379
Drone	236
key	

Value	Count
w	447
a	258
leftButton	243
d	241
leftShift	199
s	191
e	14
h	7
space	6
m	5
tab	2
backquote	1
"" (empty string)	1

Value

Value	Count
pressed	1,615

One interesting detail worth preserving exactly from the log is that **one** `InputEvent` has `key` **equal to an empty string ("")**. I have not interpreted or corrected that value—it is recorded that way in the document. The file also directly shows examples such as `Player` + `Move` and `Drone` + `Move`, confirming that `playerOrDrone` is not limited to the player.
